

Detect cycles in directed graph

Wednesday, May 28, 2025 5:04 PM

↳ Determine whether a path is possible and visit is done or not
visit হলে cycle আছে

```
#include<bits/stdc++.h>
bool dfs(int node,vector<vector<int>>&adj,vector<int>&vis,vector<int>&pathVis)
{
    vis[node] = 1;
    pathVis[node] = 1;

    for(auto nbr:adj[node]){
        if(!vis[nbr])
        {
            if(dfs(nbr,adj,vis,pathVis))return true;
        }
        else if(pathVis[nbr])return true;
    }
    pathVis[node] = 0; } dfs যদি complete হয় আর pathvisit আরও 0 হবে
return false;
}

int detectCycleInDirectedGraph(int n, vector < pair < int, int >> & edges) {
    // Write your code here.
    vector<vector<int>>>adj(n+1);
    for(auto pair: edges)
    {
        int u = pair.first;
        int v = pair.second;
        adj[u].push_back(v);
    }
    vector<int>vis(n+1,0);
    vector<int>pathVis(n+1,0);
    for(int i = 1;i<=n;i++)
    {
        if(!vis[i])
        {
            if(dfs(i,adj,vis,pathVis))return 1;
        }
    }
    return 0;
}
```
